// MinTuts/Procedural Terrain.shader

```
Shader "MinTuts/Procedural Terrain" {
  SubShader {
    Pass {
     CGPROGRAM
        #pragma vertex
                         vert
       #pragma fragment frag
       #include "UnityCG.cginc"
       struct v2f {
          float4 pos : SV POSITION;
          float3 wpos : POSITION1;
        };
       v2f vert(float4 vertex : POSITION) {
          v2f o;
          o.pos = UnityObjectToClipPos(vertex);
          o.wpos = mul(unity_ObjectToWorld, vertex);
          return o;
        float4 frag(v2f i) : COLOR {
          float p = i.wpos.y * 0.015;
          float3 y = float3(p, p, p);
          return float4(y, 1);
     ENDCG
```

CGPROGRAM/ENDCG specify *where* the **Cg** code **Unity** needs to <u>compile</u> is

Everything between **CGPROGRAM/ENDCG** is **NVIDIA**'s **Cg** (aka <u>C for graphics</u>)

You can mix HLSL (High-Level Shader Language or High-Level Shading Language; aka Microsoft's DirectX) and Cg

// MinTuts/Procedural Terrain.shader

```
Shader "MinTuts/Procedural Terrain" {
  SubShader {
    Pass {
      CGPROGRAM
       #pragma vertex
                         vert
       #pragma fragment frag
       #include "UnityCG.cginc"
       struct v2f {
          float4 pos : SV POSITION;
          float3 wpos : POSITION1;
        };
       v2f vert(float4 vertex : POSITION) {
          v2f o;
          o.pos = UnityObjectToClipPos(vertex);
          o.wpos = mul(unity_ObjectToWorld, vertex);
          return o;
        float4 frag(v2f i) : COLOR {
          float p = i.wpos.y * 0.015;
          float3 y = float3(p, p, p);
          return float4(y, 1);
      ENDCG
```

These are *compilation directives*

"#pragma gives the compiler special instructions for the compilation of the file in which it appears.

The instructions must be supported by the compiler."

—Microsoft docs
